JOB MARKET PAPER

Open Banking and Competition in Banks and Fintech: Evidence from Mobile Apps

Abstract: Open banking policies have been introduced by governments to expand consumer access to finance, yet we know little about its effects on competition in the financial services sector. Linking official open-banking authorization records to historical Android app source code, I track Open Banking adoption in fintech apps and show that access to bank data raises app performance, especially for lending and investing apps, fintech startups, and during COVID when branches were constrained. Using text from app descriptions, I further show that incumbent banks most exposed to competitive pressure from open banking experience declines in loan issuance and income but respond strategically by raising fee intensity and asset yields. Overall, the results underscore the value of data in competition.
